## 1. INTRODUCTION

### 1.1 Overview

Carbon dioxide Co2 is a colourless , odourless and non poisonous gas formed by combustion of carbon and in the respiration of living organisms and is considered a greenhouse gas. Emissions mean the release of greenhouse gases and their precursors into the atmosphere over a specified area and period of time.

Carbon dioxide emissions or Co2 emissions are emissions stemming from the burning of fossil fuels and the manufacture of cement. They include carbon dioxide produced during consumption of solid, liquid and gas fuels as well as gas flaring. John Tyndall discovered the warming effect of the carbon dioxide emission.

The amount of Co2 in the atmosphere has increased greatly since human beings began burning large amount of coal and petroleum in the nineteenth century

### 1.2 Purpose

The market for CO2 use will likely remain relatively small in the short term, but early opportunities can be cultivated CO2 use has potential to support climate goals, but robust life-cycle assessment is essential. CO2 could be an important raw material for products that require carbon.

## 2. PROBLEM DEFINITION AND DESIGN THINKING

### 2.1 Empathy map

## 2.2 Ideation and Brainstorming Map

#### 4. ADVANTAGES AND DISADVANTAGE:

##### **Advantage:**

Because air pollution and greenhouse gases are often released from the same sources, cutting greenhouse gas emissions in an effort to slow climate change also reduces air pollutants, such as fine particulate matter (PM2.5). Reducing these co-emitted air pollutants improves air quality and benefits human health.

##### **Disadvantage**

Our carbon footprint has a negative impact on the environment in multiple ways it is the main cause of human induced climate change, it contributes to urban air pollution, it leads to toxic acid rain, it adds to coastal and ocean acidification, and it worsens the melting of glaciers and polar ice.

#### 5. FUTURE SCOPES

To help direct and indirect emissions sorceries improve transparency. And provide utility for different types of organizations and different types of climate policies and business goals, three scopes are defined for GHG accounting and reporting purpose

##### **Scope 1              Direct GHG EMISSION**

Direct GHG emissions occur from sources that are owned or controlled by the company. Emissions from chemical production in owned or controlled process equipment.

Example: CO<sub>2</sub>, NO<sub>x</sub>, burning fuel in our fleet of vehicles etc.,

##### **Scope 2              Electricity Indirect GHG Emission**

Purchased electricity is defined as electricity that is purchased or otherwise brought into the organizational boundary of the company. Emissions physically occur at the facility where electricity is generated

**Scope 3 Other Indirect GHG Emission**

Scope 3 is an optional reporting category that allows for the treatment of all other indirect emissions.

Some example of scope 3 activities are extraction and production of purchased materials transportation of purchased fuels, and use of products and services.

**6. CONCLUSION**

As 'Sylvan Wittwer' the agricultural research ON THE TOPIC, SO eloquently agricultural research on this topic , so eloquently put it nearly two decades ago.

" The rising level of atmospheric Co2 could be the one global natural resources that is progressively increasing food production and total biological output, in a world of otherwise diminishing natural resources of land, water, energy, mineral, and fertilizer"
